

Stairwell macOS Forwarder 1.6.10

Release Notes

Version: 1.6.10.1319

Date: Jun 25, 2025

New Features

FOR-682: RegistrationHelper asking for credentials when upgrading

When upgrading to version 1.6.8 from some earlier versions, the installer would show a dialog asking for an administrator account and password. This version has been fixed to not do that.

FOR-683: CPU at 99%

When running applications that create a lot of filesystem activity (e.g. software build environments), and in conjunction with some other Endpoint Security products, the Stairwell Forwarder would use substantial amounts of CPU time. This has been substantially reduced for these cases.

To further reduce the CPU consumption of the forwarder, you can consider adjusting the "Batch Upload Rate Limit" in the Stairwell Policy for the environment or for an asset group.

Bug Fixes

FOR-589: MacOS forwarder thinks Java .class files are Mach-O files

The forwarder has been improved to better discriminate between Java .class files, and Apple Mach-O Universal binaries.
