

Stairwell macOS Forwarder 1.6.8

Release Notes

Version: 1.6.8.1226

Date: Apr 14, 2025

New Features

FOR-460: Add quarantine data for MacOS uploads

When files are uploaded to the Stairwell service, they now include information about whether they were downloaded from the Internet, and if so, what website they were downloaded from.

Bug Fixes

FOR-564: Implement backoff for Metadata updates

This version of the forwarder implements a feature that can be used to automatically "decommission" assets when a Stairwell environment is deactivated. This dramatically reduces the network bandwidth used, and prevents any additional data being uploaded from accounts that are no longer active.

FOR-530: Null pointer crash in ForwardingQueue.forwardEnqueuedFiles

There were occasional rare crashes in the forwarder caused by a race condition when handling events.

FOR-601: Install/upgrade failures

Depending on the configuration of the managed profiles on a Mac, installs and upgrades can fail, despite permissions actually being adequate. We are now more-permissive in these cases.

QA-46: Log file erased on crash or reboot

When the forwarder crashed, or when the system was rebooted, some log file messages would get overwritten. We now retain these log messages properly.
